蒲公英 (虚拟局域网操作)

- 1. 下载蒲公英
- 2. 登陆

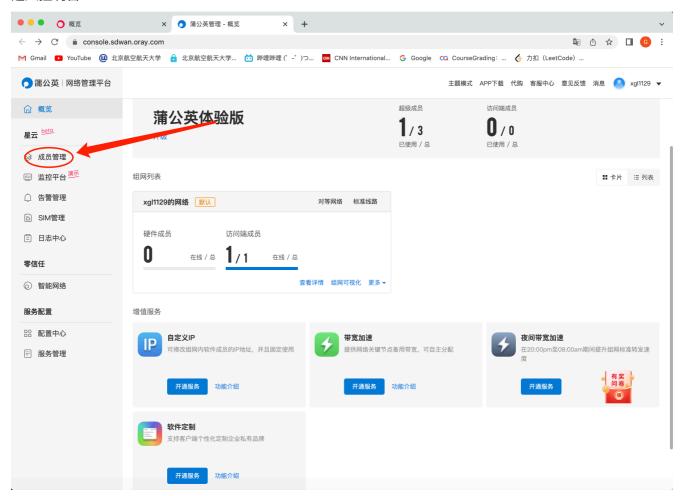

3. 进入页面

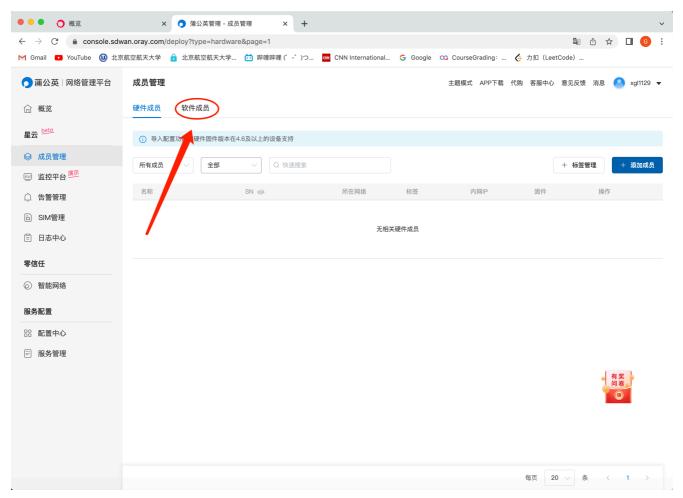

- Q 搜索设备(名称/UID/SID/IP)
- **bogon** 172.16.1.252 本机
- 51568459:002 172.16.1.83

所属网络 xgl1129的网络

4. 进入控制台

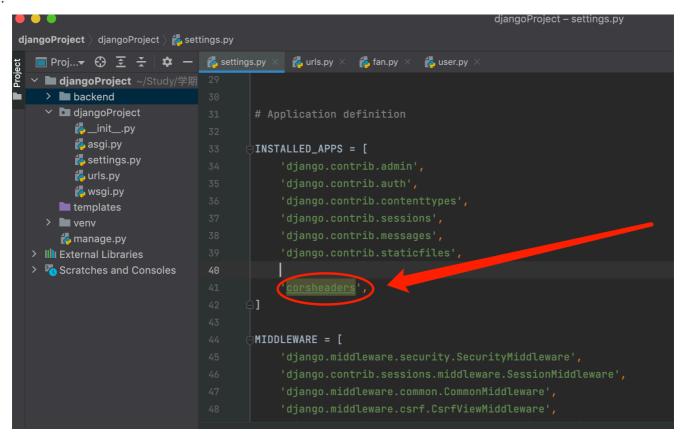

5. 只要登陆同一个账号密码,就可以自动在同一个虚拟局域网。

后端setting改动

1.

```
djangoProject – settings.py
djangoProject > djangoProject > 🛵 settings.py
  ื urls.py
                                                      ื fan.py
                                                                 ื user.py
 ✓ ■ djangoProject ~/Study/学期
                                     DEBUG = True
    > a backend
    djangoProject
                                     ALLOWED_HOSTS = ["*"]
        🛵 __init__.py
        🖧 asgi.py
        🖧 settings.py
        🚜 urls.py
        🛵 wsgi.py
      templates
                                     INSTALLED_APPS = [
    > wenv
      the manage.py
  > III External Libraries
  > Caratches and Consoles
                                     MIDDLEWARE = [
```

加入'corsheaders',

```
MIDDLEWARE = [
'django.middleware.security.SecurityMiddleware',
'django.contrib.sessions.middleware.SessionMiddleware',
'corsheaders.middleware.CorsMiddleware',
'django.middleware.common.CommonMiddleware',
'django.middleware.csrf.CsrfViewMiddleware',
'django.contrib.auth.middleware.AutherticationMiddleware',
'django.contrib.messages.middleware dessageMiddleware',
'django.middleware.clickjacking.y rameOptionsMiddleware',
'django.middleware.clickjacking.y rameOptionsMiddleware',

'django.middleware.clickjacking.y rameOptionsMiddleware',
```

3. 第三行加入'corsheaders.middleware.CorsMiddleware',

第五行注释

```
djangoProject - settings.py
djangoProject > la backend
  Proj...▼ ⊕ 💆 🛣 🗘 — 🐉 settings.py × 🐉 urls.py × 🐉 fan.py × 🐉 user.py 🤄

✓ ■ djangoProject ~/Study/学期

                                     DEFAULT_AUTO_FIELD = 'django.db.models.BigAutoField'
      backend
    djangoProject
        🛵 __init__.py
                                      # from corsheaders.defaults import default_methods
        🛵 asgi.py
        💪 settings.py
                                     CORS_ALLOW_METHODS = (
        💤 urls.py
        🛵 wsgi.py
      templates
    > less venv
      the manage.py
  > IIII External Libraries
  > Caratches and Consoles
                                        #. 允许跨域的请求头,可以使用默认值,默认的请求头为:
                                      # from corsheaders.defaults import default_headers
                                      # CORS_ALLOW_HEADERS = default_headers
                                     CORS_ALLOW_HEADERS = (
                                        # 跨域请求时,是否运行携带cookie,默认为False
                                     CORS_ALLOW_CREDENTIALS = True
                                      # 允许所有主机执行跨站点请求,默认为False
```

4. 在文件末尾加入一下代码:

```
# 跨域允许的请求方式,可以使用默认值,默认的请求方式为:
# from corsheaders.defaults import default_methods

CORS_ALLOW_METHODS = (
    'GET',
    'POST',
    'PUT',
    'PATCH',
    'DELETE',
    'OPTIONS'
)

# 允许跨域的请求头,可以使用默认值,默认的请求头为:
# from corsheaders.defaults import default_headers
# CORS_ALLOW_HEADERS = default_headers

CORS_ALLOW_HEADERS = (
```

```
'XMLHttpRequest',
 'X_FILENAME',
 'accept-encoding',
 'authorization',
 'content-type',
 'dnt',
 'origin',
 'user-agent',
 'x-csrftoken',
 'x-requested-with',
 'Pragma',
  # 跨域请求时,是否运行携带cookie, 默认为False
CORS_ALLOW_CREDENTIALS = True
# 允许所有主机执行跨站点请求,默认为False
# 如果没设置该参数,则必须设置白名单,运行部分白名单的主机才能执行跨站点请求
CORS_ORIGIN_ALLOW_ALL = True
```

5. 运行指令

运行指令是

python manage.py runserver 0.0.0.0:8000
